1. Welcome to FieldGrow

FieldGrow is a business operating system for service companies that manage customer enquiries, appointments, technicians and on-site work. It brings the key parts of a service business into one connected platform—from the first customer request to job completion, billing, feedback and the next service opportunity.

Many businesses manage work through a combination of WhatsApp, phone calls, spreadsheets, maps, accounting tools and paper job cards. These tools may work individually, but important information can become scattered. FieldGrow is designed to give the business one place to organise work, understand what is happening and follow up on opportunities.

FieldGrow's central idea

A completed service should not be the end of the customer relationship. It can create a review, a maintenance reminder, an AMC renewal opportunity and the customer's next booking.

2. Who FieldGrow is designed for

FieldGrow is designed for service businesses of different sizes, including companies that manage technicians, multiple service locations or growing service operations.

- AC, HVAC and appliance installation, repair and maintenance
- CCTV, security, networking and access-control services
- Pest control and cleaning services
- Electrical and plumbing contractors
- Home-service providers
- Facilities maintenance and multi-site service operators

The platform uses shared business workflows while allowing each company to organise its own services, job information, checklists and service processes.

3. The business problems FieldGrow addresses

Business challenge	What can happen	How FieldGrow helps

Limited job visibility	Managers need to call technicians to understand job status or arrival time.	A central job board with status, assignment and ETA information.
Enquiries get missed	Requests are spread across calls, WhatsApp chats and other channels.	Record customer requests and organise them into a defined service and booking process.
Customer history is scattered	Service details and asset knowledge may be lost when employees leave.	A Customer 360 record with service and asset history.
Quotations are not followed up	Estimates may remain unanswered until the customer chooses another provider.	Track quotation status and identify follow-up opportunities.
Cash and profitability are unclear	Revenue may be visible without the full cost of parts, travel and labour.	Payment records and job-level cost and profitability views.
Repeat business is missed	Past customers may not receive maintenance reminders or renewal follow-ups.	Identify customers due for service, AMC renewal or reactivation.
The owner coordinates everything	Daily operations depend on calls, memory and manual follow-ups.	Shared records, responsibilities, workflows and dashboards.

4. The FieldGrow Service-to-Growth Engine™

The Service-to-Growth Engine™ is FieldGrow's central product concept. It connects field operations with customer retention and business growth. A service visit creates useful information that can support the next customer interaction.

Stage	What happens
Capture	A website enquiry, WhatsApp message, phone call or walk-in request is recorded as a customer service enquiry or request.
Book	The customer and business agree on a service slot, and a technician can be assigned.
Serve	The technician navigates to the location, follows the job instructions and records the work.
Collect	The business prepares an invoice and records the payment with a clear transaction trail.
Grow	The business can request a review, publish service proof, follow up on maintenance and offer an AMC.
Repeat	The customer receives a relevant reminder or offer and can book another service.

Why this matters

FieldGrow is designed to connect job completion with customer reviews, repeat bookings and future revenue opportunities—not only track whether a technician finished a task.

5. Product modules and capabilities

5.1 Admin dashboard and command centre

The admin experience gives owners and managers a central place to understand the day's work and identify items that need attention.

- View job status, schedules, assignments and operational exceptions.
- Review customer, employee and business activity.
- See pending work, delayed jobs and follow-up requirements.
- Access invoices, payments, payroll and expense information where enabled.

Business benefit: Managers can make decisions using shared operational information instead of relying only on calls and messages.

Record potential customer enquiries and give each enquiry an owner and a next step.

- Record contact details, service interest, location and enquiry notes.

- Identify pending or lost opportunities and record reasons.

Business benefit: Fewer enquiries are forgotten, and the business can see where potential work comes from.

5.3 Customer 360

Customer 360 brings the important information about a customer into one profile.

- Customer contact details and service addresses.
- Previous and current jobs, quotations and invoices.
- Assets and equipment associated with the customer.
- Service notes, photos, complaints and feedback where recorded.
- AMC, warranty and next-service information where configured.
- A view of customer value and outstanding business activity where supported.

Business benefit: Employees can understand the customer's history before responding to a new request.

5.4 Service catalogue, packages and pricing

Businesses can organise the work they sell and define the information needed to deliver each service.

- Create service categories, subcategories and packages.
- Configure labour, material and fixed-price items.
- Define service duration, charges and applicable taxes.
- Set required technician skills, equipment or job checklists.
- Support fixed-price, inspection-based and time-and-material service models.

Business benefit: Different industries can use the same platform without being forced into one generic service list.

5.5 Quotations and estimates

Prepare an estimate before work begins when the scope or price needs customer approval.

- Create quotations with services, products, labour, materials, discounts and taxes.
- Share quotations with customers through supported communication channels.
- Record approval, rejection or revision status.
- Track quotation expiry and follow-up requirements.
- Convert an accepted quotation into a booking or job according to the configured workflow.

Business benefit: The sales and operations teams can follow a clearer path from estimate to confirmed work.

5.6 Booking and appointment management

Organise customer service requests into planned appointments.

- Create bookings from enquiries or customer requests.
- Manage service dates and available time slots.
- Record service location and customer requirements.
- Reschedule or cancel appointments and retain their status history.
- Support customer-facing booking flows where enabled.
- Send appointment confirmations and reminders through configured channels.

Business benefit: Customers and employees have a clearer understanding of when service is expected.

5.7 Job and work-order management

A job is the operational record of the work the business needs to complete.

- Create a job from a booking or approved quotation.
- Record customer, location, service, priority and scheduled time.
- Assign one or more technicians where the workflow requires it.
- Track job status and status history.

- Attach job instructions, custom forms and checklists.
- Record notes, photos, materials, labour and customer confirmation.
- Identify jobs that are pending, delayed, on hold or completed.

Business benefit: Every job has a clearer owner, status and service record.

5.8 Smart scheduling and dispatch

Scheduling and dispatch help managers coordinate the right work with available field employees.

- View schedules and assigned jobs.
- Check technician availability and workload.
- Assign and reassign jobs.
- Consider service skills and job requirements.
- Use map and location information to support dispatch decisions.
- Review estimated arrival times and delayed work where tracking is enabled.

Business benefit: Dispatchers can coordinate field work with less manual back-and-forth.

5.9 Maps, location and technician tracking

Map-based information helps teams understand where jobs and field employees are in relation to service locations.

- Open customer locations for navigation.
- View job locations on a map.
- Use Google Maps-based tracking or navigation capabilities where configured.
- Share or display technician ETA where supported.
- Use location information to support dispatch and route planning.

Business benefit: Customers and managers can get better visibility into field visits. Location access should be transparent and limited to legitimate business purposes.

5.10 Technician mobile application

The technician experience is designed for employees who complete work at customer locations.

- View today's jobs and upcoming assignments.
- Open job details, customer information and navigation.
- Update job status and record time or work progress.
- Complete checklists and custom forms.
- Capture before-and-after photos and service notes.
- Record parts used and customer signatures.
- Create or access invoice and payment information where enabled.
- Continue selected work offline and synchronise updates when connectivity returns.

Business benefit: Technicians have the job information they need without depending on repeated calls to the office.

5.11 Offline-first job execution

Field work can happen in basements, industrial sites or locations with weak mobile connectivity.

- Access previously synchronised job information.
- Record supported job updates while offline.
- Capture photos, checklist responses and signatures where supported.
- Queue changes for synchronisation when the network returns.
- Show or manage synchronisation status.

Business benefit: A weak network is less likely to interrupt the technician's ability to record service work. Exact offline functions depend on the app release and configuration.

5.12 Asset and service history

Keep a record of equipment or assets that a business installs, maintains or repairs.

- Associate assets with customers and service locations.
- Record equipment identifiers and relevant details.
- Review previous service work and asset history.
- Connect maintenance visits and contracts to assets where configured.

Business benefit: Technicians can understand what equipment was serviced previously and what work may be due.

5.13 Inventory, parts and materials

Record the materials used to complete jobs and maintain visibility into stock.

- Maintain a product and spare-parts catalogue.
- Track stock by warehouse, branch or technician where configured.
- Record material consumption against a job.
- Record stock transfers, returns and adjustments.
- Review low-stock information and purchase requirements where enabled.

Business benefit: The business can better understand material usage and include relevant costs in job calculations.

5.14 Billing, invoices and payment collection

Connect completed service work with billing and payment records.

- Generate invoices from completed work or approved charges.
- Record service, labour, material, discount and tax details.
- Record full, partial or advance payments where supported.
- Track payment method and collection status.
- Share invoices and receipts through supported channels.
- Review outstanding amounts and payment reminders.

Business benefit: The business has a clearer record of what was billed, what was collected and what remains outstanding.

5.15 Job profitability

Revenue alone does not show whether a job made money. Job profitability considers the costs associated with the work.

- Review job revenue.
- Include recorded material and spare-part costs.
- Include labour, travel, expenses and commissions where configured.
- Compare job-level revenue and recorded costs.
- Identify jobs or service types that may need pricing review.

Business benefit: Owners can make better decisions about service pricing and operating costs. Results depend on accurate cost entry and configuration.

5.16 Payroll, employee performance and expenses

FieldGrow's product experience includes employee and performance information alongside operational and financial records.

- Review employee activity and assigned work.
- Record expenses associated with field operations.
- Review payroll-related information where enabled.
- Measure service indicators such as completed jobs, ratings and rework where data is available.
- Use performance information to support coaching and workload decisions.

Business benefit: Owners can understand more than just how many kilometres or jobs an employee completed. Payroll and statutory calculations should be verified against the business's configured payroll process.

5.17 AMC, contracts and maintenance reminders

Annual Maintenance Contracts and recurring maintenance records help businesses manage ongoing customer relationships.

- Record contract dates, covered services and customer assets.
- Plan included or recurring service visits.
- Track upcoming contract renewals.
- Identify customers due for maintenance.
- Create reminders and follow-up campaigns.
- Convert an interested customer into a new booking or renewal.

Business benefit: The business can follow up before a contract or maintenance opportunity is missed.

5.18 Complaints and service quality

Record service issues and use the history to support resolution and quality improvement.

- Register customer complaints and service concerns.
- Link a complaint to a customer and previous job where applicable.
- Assign responsibility and record updates.
- Track repeat issues and rework.
- Collect customer feedback and ratings.

Business benefit: Managers can identify recurring service problems and improve the customer experience.

5.19 WhatsApp and customer communication

FieldGrow's website presents WhatsApp-first booking and customer communication as a key part of the product experience.

- Capture or manage enquiries originating from WhatsApp where integration is enabled.
- Send booking and appointment updates.
- Share quotations, invoices or service information through supported workflows.
- Send job-completion and review requests.
- Follow up on quotations, maintenance and dormant customers.
- Use SMS or email notification workflows where configured.

Business benefit: Businesses can communicate through channels familiar to their customers. WhatsApp automation requires the relevant account, templates, permissions and integration setup.

5.20 Portfolio website and online booking

A business portfolio website can help present services and turn visitors into enquiries or bookings.

- Display the business brand and service catalogue.
- Present service areas and contact information.
- Show work examples and customer reviews where provided.
- Provide enquiry or booking entry points.
- Support a branded online presence and custom-domain deployment where available.

Business benefit: The business can create another path for customers to discover and request services.

5.21 Customer experience and self-service

Customer-facing capabilities are designed to make it easier for customers to interact with the service business.

- Request or book a service through enabled channels.
- Receive appointment and service updates.

- View technician arrival or tracking information where enabled.
- Access quotations, invoices and payment options where enabled.
- Review service history and provide feedback.

Business benefit: Customers can receive clearer information without needing to call the office for every update.

5.22 Reviews and reputation management

A completed job can be followed by a request for customer feedback or a public review.

- Trigger review requests after eligible jobs.
- Use customer feedback to understand service quality.
- Encourage satisfied customers to share their experience.
- Use review and service proof in marketing activities where permitted.

Business benefit: A consistent review process can help a service business build trust and strengthen its online reputation. Review requests should follow platform policies and should not manipulate or filter customer feedback inappropriately.

5.23 Marketing, social content and customer reactivation

FieldGrow's growth capabilities connect completed work and customer records with marketing opportunities.

- Create social content from completed service details.
- Prepare WhatsApp or Instagram post drafts with service information and optional before-and-after proof.
- Identify dormant customers for reactivation.
- Follow up on stale quotations.
- Prepare AMC and maintenance renewal campaigns.
- Track campaign sources and resulting bookings where configured.

Business benefit: The business can turn completed work and existing customer relationships into new opportunities. Content should be reviewed before publishing.

5.24 Missed Revenue Engine

The Missed Revenue Engine is designed to surface business opportunities that may otherwise remain unnoticed.

- AMC renewals that are due.
- Customers who have not returned.
- Quotations that have not been accepted.
- Customers due for maintenance.
- Suggested follow-up actions to help recover potential work.

Business benefit: Owners can see where follow-up may create additional bookings. Any displayed recovery amount is an estimate of opportunity, not guaranteed revenue.

5.25 Revenue recovery simulator

The marketing demo includes an interactive simulator where a visitor can adjust example business inputs such as technician count, monthly jobs and average job value.

- Explore example recovery opportunities from dormant customers.
- See how pending quotations may represent potential work.
- Explore possible AMC and maintenance renewals.
- Understand how follow-up activity could affect estimated monthly recovery.

Business benefit: The simulator is an illustration to help explain the concept. Its output is not a forecast, promise, customer result or guarantee of revenue.

5.26 AI-assisted recommendations

AI-assisted capabilities can help turn existing business information into useful suggestions and draft content.

- Generate draft social posts from completed job information.
- Suggest customer follow-ups or service opportunities.
- Assist with identifying patterns in quotations, maintenance and customer activity.
- Support recommendations for the next relevant customer action where configured.

Business benefit: AI outputs should be reviewed by an authorised employee before they are sent to customers or used for business decisions.

6. Admin, technician and customer experiences

Experience	Typical capabilities
Admin / Owner	Dashboard and command centre; customers and Customer 360; employees and performance; scheduling and dispatch; maps and tracking; invoices, payroll and expenses; growth opportunities.
Technician	Today's jobs; navigation; job details; checklists and parts; photos and signatures; time and status updates; on-site payment; offline-first sync where supported.
Customer	Service booking; appointment updates; technician tracking where enabled; invoice and payment access; service history; feedback and reviews.
Growth / Marketing	Portfolio website; WhatsApp booking; Google review requests; AI social posts; AMC campaigns; dormant-customer follow-ups; Missed Revenue opportunities.

7. End-to-end business workflows

A. Enquiry to confirmed booking

1. A customer contacts the business through a website, WhatsApp, phone call or walk-in.
2. The enquiry is recorded with customer details, service need and location.
3. The team contacts the customer and confirms the service requirement.
4. If needed, the business creates and shares a quotation.
5. After approval, the team confirms a booking and service slot.

B. Booking to job completion

6. The booking is converted into a job or work order.
7. The dispatcher assigns an available technician.
8. The technician reviews the job and travels to the service location.
9. The technician records arrival, work progress, checklist results and materials.
10. The technician records photos and customer confirmation as required.
11. The job is marked complete after the required steps are satisfied.

C. Job completion to payment

12. The business reviews the completed work and charges.
13. An invoice is prepared and shared with the customer.
14. The customer pays using an accepted payment method.
15. The payment is recorded against the invoice.
16. The business follows up on any remaining balance.

D. Completed job to repeat revenue

17. The completed service is added to the customer's history.
18. The business requests feedback or a review where appropriate.
19. The business identifies the next maintenance date or AMC renewal.

20. A reminder or follow-up is scheduled.
21. The customer can request another service or renew a contract.

8. Industry-specific examples

Industry	Example ways to use FieldGrow
AC / HVAC / Appliances	Installation, repair, gas filling, preventive maintenance, asset details, seasonal demand and AMC cycles.
CCTV / Security / Networking	Camera and device installation, DVR/NVR information, cabling, troubleshooting and maintenance contracts.
Pest control	Inspection, treatment type, service area, materials used, revisit schedules and recurring packages.
Cleaning	Property or area details, cleaning type, team assignment, checklist, duration and completion photos.
Electrical	Wiring, installation, repair, fittings, materials and job-specific safety checks.
Plumbing	Leakage, pipe and fitting details, repair work, materials and service notes.
Facilities maintenance	Assets, service-level requirements, multiple sites, recurring maintenance and multi-site dispatch.
Home services	Online booking, recurring visits, customer communication and reputation management.

These are examples of how a business may configure its service catalogue and job information. The exact fields, checklists and workflows should be agreed during onboarding.

9. Missed Revenue Engine and revenue simulator

Many service businesses have opportunities already present in their customer and operations data, but no reliable process to act on them. FieldGrow's Missed Revenue concept is intended to make these opportunities easier to see and follow up.

Opportunity type	Example	Possible next action
AMC renewal due	A customer's maintenance contract is approaching its renewal date.	Contact the customer with renewal details.
Dormant customer	A previous customer has not booked again within the expected period.	Send a relevant reactivation message.
Unaccepted quotation	A quotation was shared but no decision has been recorded.	Follow up and answer questions.
Maintenance due	An asset or customer is approaching its next recommended service date.	Offer an appointment or maintenance package.

Understanding the simulator

The website's revenue simulator uses example inputs to demonstrate potential recovery opportunities. It is an educational estimate only. Actual results depend on customer response, pricing, service capacity, data quality and follow-up execution.

10. Reports, visibility and business performance

Area	Questions FieldGrow can help the business review
Customer requests and quotations	How many customer requests arrived? Which quotations need follow-up? Which quotations are pending or accepted?
Jobs and operations	How many jobs are scheduled, assigned, in progress, delayed or completed?
Technicians	What work is assigned and completed? What is the recorded workload and service performance?
Billing and collections	What has been invoiced? What payments are recorded? Which

	balances remain outstanding?
Job profitability	What revenue and costs have been recorded for a job or service type?
Inventory	Which materials were used? What stock is available or needs replenishment?
Customer growth	Which customers are due for maintenance, AMC renewal, review requests or reactivation?

Reports depend on the information entered into FieldGrow and the modules enabled for the business. Accurate job, cost, stock and payment records are essential for useful reporting.

11. Getting started with FieldGrow

22. Discuss your business type, services, branches and current process.
23. Set up your business profile, contact details and working hours.
24. Configure service categories, packages, pricing and taxes.
25. Add employees and assign roles and permissions.
26. Import or create customer records and relevant asset information.
27. Configure customer, quotation, booking and job workflows.
28. Set up technician schedules, service areas and dispatch practices.
29. Configure invoices, payment methods and expense processes.
30. Connect supported communication, maps and payment integrations where required.
31. Train administrators, dispatchers, sales employees and technicians.
32. Start with a controlled group of jobs, review the workflow and then expand usage.

12. Frequently asked questions

Is FieldGrow only for AC service businesses?

No. It is designed for a range of field-service industries, including HVAC, CCTV, pest control, cleaning, electrical, plumbing, facilities maintenance and home services.

FieldGrow is designed for service businesses of different sizes, including companies that manage technicians, multiple service locations or growing service operations.

FieldGrow helps businesses coordinate technicians, assign jobs and manage schedules. The setup can be tailored to the size and structure of the service team.

Can we manage enquiries from different channels?

The product is designed to capture enquiries from website, WhatsApp, calls, walk-ins and other configured sources. Specific channel integrations may require setup.

Can customers book services online?

The website presents online booking and customer booking flows as part of the product experience. Availability and booking options depend on the business setup.

Can we track technicians?

Map and technician tracking capabilities are presented on the product website. Tracking behaviour depends on device permissions, connectivity and configuration.

Will the technician app work without internet?

The product is designed with offline-first technician workflows. The exact information and actions available offline depend on the app version and synchronisation setup.

Can we create quotations?

Yes. Quotation and estimate management is part of the described product workflow, including sharing and follow-up.

Can we track parts used on a job?

FieldGrow includes job materials and inventory-related capabilities. The business needs to configure its products, stock locations and usage process.

Can we manage AMC renewals?

FieldGrow is designed to record maintenance contracts and surface renewal or maintenance follow-up opportunities.

Can we see job profitability?

The product includes job-level profitability concepts based on revenue and recorded costs. Accurate cost data is needed for meaningful results.

Does FieldGrow support WhatsApp?

WhatsApp booking and communication are central to the product positioning. Actual automation requires the relevant WhatsApp Business setup and integration.

Can we use our own company branding?

The portfolio website capability is intended to support a business-branded online presence. Branding and custom-domain options should be confirmed during onboarding.

Can we manage multiple branches or service locations?

FieldGrow is intended to support growing and multi-site service operations. The branch structure and access rules should be configured for the business.

Can we collect customer reviews?

FieldGrow includes review-request and reputation-growth workflows. Public review collection is subject to the relevant platform's policies.

Does the revenue simulator guarantee additional revenue?

No. It is an illustrative calculator showing potential opportunities. It does not guarantee bookings, customer responses or revenue.

Can AI publish content automatically?

AI-assisted social content can help prepare drafts. A responsible business workflow should review content before publication.

Can we migrate data from spreadsheets?

The FieldGrow product positioning includes free or low-cost migration. The data format, scope and migration effort should be assessed before onboarding.

How do we get a product demonstration?

Use the demo website or contact the FieldGrow team using the details at the end of this guide.

13. Product availability and implementation notes

This guide describes the FieldGrow product vision and the capabilities presented on the FieldGrow marketing demo website. Not every capability should be assumed to be enabled in every customer account or available in every release.

- Some capabilities may depend on subscription plan, configuration, onboarding or additional integration setup.
- WhatsApp, Google Maps, payment, email and other third-party services may require customer-owned accounts, permissions or usage charges.
- Offline functionality can vary by app version and by the data synchronised before the device loses connectivity.
- GPS and location features require appropriate device permissions and connectivity.
- Payroll, GST, invoicing and accounting workflows should be configured and reviewed for the customer's business and applicable requirements.
- Revenue simulator values and missed-revenue estimates are indicative and are not guaranteed financial outcomes.
- Any customer stories, sample figures or dashboard values shown in a demo should be treated as illustrative unless FieldGrow separately confirms they are verified customer results.

Before onboarding

Ask the FieldGrow team to confirm which modules are currently available, which integrations are included, what requires configuration and what is planned for a future release.

14. Request a FieldGrow product walkthrough

Every service business has its own process for handling enquiries, scheduling visits, completing work and collecting payments. A product walkthrough can help identify how FieldGrow may fit your current workflow and which capabilities are most relevant to your team.

- Website demo: https://fieldgrow-marketing.vercel.app/
- Email: hello@fieldgrow.app
- Phone: +91 98765 43210

Let's make field operations easier

Show us how your business works today. We can walk through the relevant FieldGrow modules and discuss a practical onboarding approach for your team.
